1. & 2. Source: Platinum for portfolio returns and Factset Research Systems for MSCI returns. The returns are calculated relative to the MSCI All Country Asia ex-Japan Net Index in A\$. The investment returns in the line graph are cumulative on A\$20,000 invested in PAI since inception. Past performance is not a reliable indicator of future returns. Platinum does not invest by reference to the weightings of the index. The index is provided as a reference only.

3. The geographic "Long %" is the exposure to long securities and long securities/index derivative positions, the geographic "Short %" is the exposure to short securities and short securities/index derivative positions and the geographic "Net %" is the difference between the geographic "Long %" and the geographic "Short %", each as a percentage of the market value of the Fund's portfolio. The "Currency %" is the effective currency exposure as a percentage of the market value of the Fund's portfolio taking into account long and short securities, cash, forwards and long and short securities/index derivative positions. The cash "Long %" includes cash at bank, cashflows expected from forwards and effective cash exposures resulting from long securities/index derivative positions, the cash "Short %" includes effective cash exposures resulting from short securities/index derivative positions and the cash "Net %" is the difference between the cash "Long %" and the cash "Short %", each as a percentage of the market value of the Fund's portfolio. For the "Industry breakdown", index positions (whether through ETFs or derivatives) are only included under the relevant sector if they are sector specific, otherwise they are included under "Other".

3. and 4. China generally refers to securities or derivatives over securities, which securities are listed on the Shanghai or Shenzhen stock exchange. China Ex PRC generally refers to securities or derivatives over securities, which securities are listed outside of the PRC but provide exposure to PRC companies.

4. The "Top ten positions" show PAI's top ten long securities positions as a percentage of PAI's portfolio value (including long securities and long securities derivative positions).

- Thanks to cash, shorts and FX we were able to protect capital in March
- Our pivot to higher quality names rather than economic leverage in Asia assisted in protecting capital.
- High quality names in our view are not crowded given Asia's lack of global investor ownership.

The portfolio turned in a pleasing performance amid weak equity markets in Asia over the last month and quarter. We have been active in trimming and adding to positions, adding and closing shorts – as we have mentioned previously such market conditions require nimbleness.

However, perhaps the main reason for the portfolio's ability to protect capital in the current environment is that we made the decision to remove economic leverage from the portfolio over the last 18 months amid weakening economic conditions. We are afforded the luxury in Asia, especially in China, of owning high-quality companies at reasonable valuations, which are not crowded, in our view.

Some background may aid understanding. Coming into 2018, it is fair to say we were wrong-footed by the severity of the impact of the trade war between the USA and China, coupled with tightening monetary policy in the US and lack of fiscal impulse in China. Where we anticipated a continuation of late cycle growth with mild inflation and steady or falling real rates as policy makers failed to get ahead of the curve as is usual, we were confronted with a sharply interrupted cycle. As a result, the portfolio entered 2018 with nearly 30% of its holdings in highly cyclical companies in materials, industrials and energy (as at the end of January 2018). This turned out to be inappropriate for the new reality of trade war and subdued growth, and led to weak performance by the portfolio in 2018 and 2019.

Over the course of 2018 we moved to reduce economic leverage in the portfolio – selling down cyclical holdings and moving funds to cash or to higher quality growth companies. The result is that as at the end of March 2020 we hold only approximately 7% of the portfolio in energy, materials and industrials. As a result, while our long positions fell by more than 3% over the month of March, we were able to largely offset this with short sales, short index positions, cash holdings and foreign exchange gains (from US dollar holdings).

As China is one of the cheapest equity markets in the world (see the accompanying PE chart) and in our view is not at all widely owned by global investors, we have been able to rotate into high quality businesses without fear of being trapped in crowded trades which can de-rate significantly during trying times such as now prevail. That said, the portfolio is characterised by holding well-known names, and its average price/earnings ratio is high at approximately 21 times trailing earnings.

We anticipate that once investor appetite for risk improves, perhaps with stabilisation of global Covid-19 cases, emerging markets may see increasing investor interest. Our experience in the 2015-2017 period is instructive here. Large cap names led non-Japan Asia as global investors re-entered the region via index tracking products and by buying familiar companies. It was only once a global "risk-on" appetite was firmly established that truly value, cyclical names outperformed.

Amid this environment two stocks have been added to the top 10 holdings in the portfolio in March. both are high quality Chinese names which we have owned and been familiar with for years. We added significantly to our holding in online retail giant JD.com during March, seeing it as a beneficiary of the lockdown in China. And we added to Anta Sports, as the share price weakened significantly on investor concerns arising from "short notes" which we see as misplaced as regards Anta's business.

Having sought to protect capital, we must now seek to grow it, as uncomfortable as that may feel. As result we have added exposure to markets over the last month, with our net exposure to markets lifting from approximately 54% at the end of February to 68% at the end of March.

Charts 1 and 2 show valuations based on sell-side consensus estimates. It is worth noting at this stage, that these earnings forecasts will almost certainly come down substantially to reflect the impact of coronavirus-related slowdown in the global economy.
