MARKET UPDATE AND COMMENTARY

- Asian markets were weak in September.
- Our contrarian holdings worked well in the month.
- The case for China – a cheap equity market and a system which has been reducing gearing for a decade.

Asian markets weak in September

Non-Japan Asian markets were weak in September, as was the portfolio, albeit considerably less so as various of our contrarian holdings worked well in the month. Property developers China Resources Land and China Vanke were among the portfolio's strongest performers for the month. In our view, some of the indiscriminate selling in the sector reversed during September. Regulatory pressure on highly indebted property developers is positive for the larger, better-run and much better-capitalised property developers that we own, which are on all-time low valuations.

No evidence of calamity

Among the detractors for the portfolio was Alibaba – we have reinitiated a position in the company, which in our view will be a larger business generating strong earnings in five years' time. Some patience may be required though. Also among detractors for the month are our holdings in chip makers Taiwan Semiconductor Manufacturing and Samsung Electronics: these are long-term holdings in a consolidated industry with its most rational industry structure in decades. So, while the equity market frets about the potential for chip prices to decline from recent peaks, we are much more interested in the excellent returns these high-quality industrial firms can generate in coming years from current, undemanding valuations.

What is remarkable about the current iteration of "China crisis" headlines is how little markets are moving in response – the Shanghai Composite Index is well off its highs for the year, but basically flat for the year to date and up healthily over three years, interbank rates and China credit default spreads are not reflecting any distress, and commodity prices remain very strong. Indications are that the Chinese economy remains very healthy.

Producer prices rose 9.5% in August and the profit of industrial enterprises in August grew 10.1% vs. a year ago (Source: CICC). China's rapid economic growth is causing some strain on its power system. Thermal coal prices are rising to historically high levels globally and some power rationing is occurring in industrial firms within China, in order to allow households to avoid such rationing. Household power demand was up 12.5% vs. a year prior in August – hardly an indication of collapsing economic activity (Source: Citi).

Revisiting the case for Chinese equities

It is worth reiterating the investment case for China. In 2007, the Chinese equity market was the most expensive major market in the world on a price-to-earnings (P/E) basis, at 27x forward earnings (Source: Credit Suisse, using the MSCI AC China Index). Its economy was lauded for growing at staggering rates – 12% that year. And the country's economic model seemed unassailable. The Shanghai Composite fell 68% in a matter of months and it remains 38% below its 2007 peak some 14 years later (Source: FactSet, as at 4 October 2021). Hence our view that, in equity market terms, China does not look like a country that is about to have a financial crisis – it looks like a country that has already had one. The MSCI AC World China has de-rated from 27x in 2007 to 11x at present, going from one of the world's most expensive equity markets to among its cheapest (Source: Credit Suisse).

China's property price appreciation has been entirely unremarkable by global standards, its interest rates are among the highest of any major economy globally, first home buyers require ~30% deposits. This latter point does not get reported remotely enough: since the post GFC debt binge ending in 2010, credit growth in China has been below nominal GDP (see accompanying chart).
